## *1 S3 objects*

1. Following the cohort example in the notes, suppose we want to create a `mean` method.
  - List all S3 methods associated with the `mean` function.
  - Examine the source code of `mean`.
  - What are the arguments of `mean`?
  - Create a function called `mean.cohort` that returns a vector containing the mean weight and mean height.<sup>1</sup>
2. Let's now make a similar function for the standard deviation
  - Look at the arguments of the `sd` function.
  - Create a function call `sd.cohort` that returns a vector containing the weight and height standard deviation.<sup>2</sup>
  - Create a default `sd` function. Look at `cor.default` in the notes for a hint.
3. Create a `summary` method for the `cohort` class. When the `summary` function is called on a `cohort` object it should call the base `summary` on the `details` element.
  - Use the `body` function to check if the function is already a generic function.
  - Use the `args` function to determine the arguments.
  - Create a `summary.cohort` function
4. Create a `hist` method for the `cohort` class. When the `hist` function is called on a `cohort` object, it should produce a single plot showing two histograms - one for height and another for weight.
5. Create a `[` method for the `cohort` class. This method should return a `cohort` object, but with the relevant rows sub setted. For example, if `cc` was a `cohort` object, then

```
cc[1:3, ]
```

would return the first three rows of the data frame.

6. Create a `[<-` method for the `cohort` class. This method should allow us to replace values in the `details` data frame, i.e.

```
cc[1,1] = 10
```

<sup>1</sup> Ensure that you can pass in the standard `mean` arguments, i.e. `na.rm`.

<sup>2</sup> Ensure that you can pass in the standard `sd` arguments, i.e. `na.rm`.

## 2 S4 objects

1. Following the `Cohort` example in the notes, suppose we want to make a generic for the `mean` function.
  - Using the `isGeneric` function, determine if the `mean` function is an `S4` generic. If not, use `setGeneric` to create an `S4` generic.
  - Using `setMethod`, create a `mean` method for the `Cohort` class.<sup>3</sup>
2. Repeat the above steps for the `sd` function.
3. Create a `summary` method for the `cohort` class
  - Use `isGeneric` to determine if an `S4` generic exists.
  - Use `setGeneric` to set the generic method (if necessary).
  - Create an `S4` summary method.
4. Create a `hist` method for the `cohort` class. When the `hist` function is called on a `cohort`, it should produce a single plot showing two histograms - one for height and another for weight.
5. Create a `[` method for the `cohort` class. This method should return a `cohort` object, but with the relevant rows sub setted.
6. Create a `<-` method for the `cohort` class. This method should allow us to replace values in the `details` data frame.

## 3 Reference classes

The example in the notes created a random number generator using a reference class.

- Reproduce the `randu` generator from the notes and make sure that it works as advertised.<sup>4</sup>
- When we initialise the random number generator, the very first state is called the `seed`. Store this variable and create a new function called `get_seed` that will return the initial seed, i.e.

```
r = randu(calls=0, seed=10, state=10)
r$r()

## [1] 0.0003051898

r$get_state()

## [1] 655390

r$get_seed()

## [1] 10
```

- Create a variable that stores the number of times the generator has been called. You should be able to access this variable with the function `get_num_calls`

I've intentionally mirrored the functions from section 1 of this practical to highlight the differences.

<sup>3</sup> Be careful to match the arguments.

<sup>4</sup> The reference class version, not the function closure generator.

Reference classes also have an `initialise` method - that way we would only specify the `seed` and would then initialise the other variables. I'll give you an example in the solutions.

```
r = randu(calls=0, seed=10, state=10)
r$get_num_calls()

## [1] 0

r$r()

## [1] 0.0003051898

r$r()

## [1] 0.001831097

r$get_num_calls()

## [1] 2
```

### Solutions

Solutions are contained within the course package

```
library("nclRadvanced")
vignette("solutions2", package="nclRadvanced")
```
