Advanced R programming: solutions 2

Dr Colin Gillespie

September 19, 2015

1 *S3 objects*

1. Following the cohort example in the notes, suppose we want to create a `mean` method.

   - List all S3 methods associated with the `mean` function.

   ```
   methods("mean")

   ## [1] mean,ANY-method    mean,Cohort-method
   ## [3] mean.Date          mean.POSIXct
   ## [5] mean.POSIXlt       mean.cohort
   ## [7] mean.default       mean.difftime
   ## see '?methods' for accessing help and source code
   ```

   - Examine the source code of `mean`.

   ```
   body("mean")
   ```

   - What are the arguments of `mean`?

   ```
   args("mean")

   ## function (x, ...)
   ## NULL
   ```

   - Create a function called `mean.cohort` that returns a vector containing the mean weight and mean height.[1]

   [1] Ensure that you can pass in the standard `mean` arguments, i.e. `na.rm`.

   ```
   mean.cohort = function(x, ...) {
     m1 = mean(x$details[ ,1], ...)
     m2 = mean(x$details[ ,2], ...)
     return(c(m1, m2))
   }
   ```

2. Let's now make a similar function for the standard deviation

   - Look at the arguments of the `sd` function.
   - Create an function call `sd.cohort` that returns a vector containing the weight and height standard deviation.[2]
   - Create a default `sd` function. Look at `cor.default` in the notes for a hint.

   [2] Ensure that you can pass in the standard `sd` arguments, i.e. `na.rm`.

   ```
   sd = function(x, ...) UseMethod("sd")
   sd.default = function(x, ...) stats::sd(x, ...)
   sd.cohort = function(x, ...) {
     s1 = sd(x$details[ ,1], ...)
     s2 = sd(x$details[ ,2], ...)
   ```

```
  return(c(s1, s2))
}
```

3. Create a `summary` method for the `cohort` class. When the `summary` function is called on a `cohort` object it should call the base `summary` on the `details` element.

   - Use the `body` function to check if the function is already a generic function.
   - Use the `args` function to determine the arguments.
   - Create a `summary.cohort` function

```
## summary is already a generic
body(summary)

## standardGeneric("summary")

## Match the args
args(summary)

## function (object, ...)
## NULL

## Function
summary.cohort = function(object, ...) summary(object$details, ...)
```

4. Create a `hist` method for the `cohort` class. When the `hist` function is called on a `cohort` object, it should produce a single plot showing two histograms - one for height and another for weight.

```
## hist is already a generic
body(hist)

## standardGeneric("hist")

## Match the args
args(hist)

## function (x, ...)
## NULL

## Function
hist.cohort = function(x, ...) {
  op = par(mfrow=c(1, 2))
  hist(x$details[,1], main="Weight")
  hist(x$details[,2], main="Height")
  par(op)
}
```

5. Create a `[` method for the `cohort` class. This method should return a `cohort` object, but with the relevant rows sub setted. For example, if `cc` was a cohort object, then

```
cc[1:3,]
```

would return the first three rows of the data frame.

```
## Lots of methods available.
methods('[')

##  [1] [,Cohort-method       [,nonStructure-method
##  [3] [.AsIs                [.Date
##  [5] [.Dlist               [.POSIXct
##  [7] [.POSIXlt             [.acf*
##  [9] [.bibentry*           [.cohort
## [11] [.data.frame          [.difftime
## [13] [.factor              [.formula*
## [15] [.fseq*               [.getAnywhere*
## [17] [.hexmode             [.listof
## [19] [.noquote             [.numeric_version
## [21] [.octmode             [.pdf_doc*
## [23] [.person*             [.raster*
## [25] [.roman*              [.simple.list
## [27] [.terms*              [.ts*
## [29] [.tskernel*           [.warnings
## see '?methods' for accessing help and source code

## Examine [.data.frame
args('[.data.frame')

## function (x, i, j, drop = if (missing(i)) TRUE else length(cols) ==
##     1)
## NULL

'[.cohort' = function(x, ...){
  x$details = x$details[...]
  x
}
```

6. Create a `[<-` method for the `cohort` class. This method should allow us to replace values in the `details` data frame, i.e.

```
cc[1,1] = 10
```

```
## Lots of methods available.
methods('[<-')

##  [1] [<-,Cohort-method     [<-,data.frame-method
```

```
##  [3] [<-.Date              [<-.POSIXct
##  [5] [<-.POSIXlt           [<-.cohort
##  [7] [<-.data.frame        [<-.factor
##  [9] [<-.numeric_version   [<-.raster*
## [11] [<-.ts*
## see '?methods' for accessing help and source code

## Examine [.data.frame
args('[<-.data.frame')

## function (x, i, j, value)
## NULL

'[<-.cohort' = function(x, i, j, value){
  x$details[i, j] = value
  x
}
cc[1:3, ] = 55
```

2 *S4 objects*

I've intentionally mirrored the functions from section 1 of this practical to highlight the differences.

1. Following the `Cohort` example in the notes, suppose we want to make a generic for the `mean` function.

   - Using the `isGeneric` function, determine if the `mean` function is an S4 generic. If not, use `setGeneric` to create an S4 generic.

   ```
   isGeneric("mean")

   ## [1] TRUE

   setGeneric("mean")

   ## [1] "mean"
   ```

   - Using `setMethod`, create a `mean` method for the `Cohort` class.[3]

   [3] Be careful to match the arguments.

   ```
   setMethod("mean", signature=c("Cohort"),
             definition=function(x, ...) {
               m1 = mean(x@details[ ,1], ...)
               m2 = mean(x@details[ ,2], ...)
               return(c(m1, m2))
             }
   )

   ## [1] "mean"
   ```

2. Repeat the above steps for the `sd` function.

```
isGeneric("sd")

## [1] TRUE
```

```
setGeneric("sd")

## [1] "sd"

setMethod("sd", signature=c("Cohort"),
          definition=function(x, na.rm=FALSE) {
            m1 = sd(x@details[ ,1], na.rm=na.rm)
            m2 = sd(x@details[ ,2], na.rm=na.rm)
            return(c(m1, m2))
          }
)

## [1] "sd"
```

3. Create a `summary` method for the `cohort` class

   - Use `isGeneric` to determine if an S4 generic exists.
   - Use `setGeneric` to set the generic method (if necessary).
   - Create an S4 summary method.

```
isGeneric("summary")

## [1] TRUE

setGeneric("summary")

## [1] "summary"

setMethod("summary", signature=c("Cohort"),
                     definition=function(object, ...) {
            summary(object@details)
          }
)

## [1] "summary"
```

4. Create a `hist` method for the `cohort` class. When the `hist` function is called on a `cohort`, it should produce a single plot showing two histograms - one for height and another for weight.

```
isGeneric("hist")

## [1] TRUE

setGeneric("hist")

## [1] "hist"
```

```
setMethod("hist", signature=c("Cohort"),
          definition=function(x, ...) {
            op = par(mfrow=c(1, 2))
            hist(x@details[,1], main="Weight", ...)
            hist(x@details[,2], main="Height", ...)
            par(op)
          }
)

## [1] "hist"
```

5. Create a `[` method for the `cohort` class. This method should return a `cohort` object, but with the relevant rows sub setted.

```
isGeneric("[")

## [1] TRUE

getGeneric('[')

## standardGeneric for "[" defined from package "base"
##
## function (x, i, j, ..., drop = TRUE)
## standardGeneric("[", .Primitive("["))
## <bytecode: 0x1f9ba80>
## <environment: 0x1f90a60>
## Methods may be defined for arguments: x, i, j, drop
## Use  showMethods("[")  for currently available ones.

## Can you determine what drop does?
setMethod("[", signature=c("Cohort"),
          definition=function(x, i, j, ..., drop = TRUE) {
            x@details = x@details[i, j, ..., drop=drop]
            x
          }
)

## [1] "["
```

6. Create a `<-` method for the `cohort` class. This method should allow us to replace values in the `details` data frame.

```
isGeneric("[<-")

## [1] TRUE

setGeneric('[<-')

## [1] "[<-"
```

```
setMethod("[<-", signature=c("Cohort"),
          definition=function(x, i, j, value) {
            x@details[i, j] = value
            x
          }
)

## [1] "[<-"

coh_s4[1,]= 5
```

3 *Reference classes*

The example in the notes created a random number generator using a reference class.

- Reproduce the `randu` generator from the notes and make sure that it works as advertised.[4]
- When we initialise the random number generator, the very first state is called the `seed`. Store this variable and create a new function called `get_seed` that will return the initial seed, i.e.

[4] The reference class version, not the function closure generator.

Reference classes also have an initialise method - that way we would only specify the seed and would then initialise the other variables. I'll give you an example in the solutions.

```
r = randu(calls=0, seed=10, state=10)
r$r()

## [1] 0.0003051898

r$get_state()

## [1] 655390

r$get_seed()

## [1] 10
```

```
##Solutions - see below
```

- Create a variable that stores the number of times the generator has been called. You should be able to access this variable with the function `get_num_calls`

```
r = randu(calls=0, seed=10, state=10)
r$get_num_calls()

## [1] 0

r$r()

## [1] 0.0003051898

r$r()
```

```
## [1] 0.001831097

r$get_num_calls()

## [1] 2
```

```
## Solutions ##
randu = setRefClass("randu",
                    fields = list(calls = "numeric",
                                  seed="numeric",
                                  state="numeric"))
randu$methods(get_state = function() state)
randu$methods(set_state = function(initial) state <<- initial)
randu$methods(get_seed = function() seed)
randu$methods(get_num_calls = function() calls)
randu$methods(r = function() {
  calls <<- calls + 1
  state <<- (65539*state) %% 2^31
  return(state/2^31)
})
```

Solutions

Solutions are contained within the course package

```
library("nclRadvanced")
vignette("solutions2", package="nclRadvanced")
```
